

Specialists in Building Integration

After years of experience in the planning of green buildings, Giuseppe Santo Marinelli founded the Italian company Ecojoule. He focused on building-integrated and combined solutions using different renewable energy sources.

Today, 50 employees and sales representatives work for Ecojoule in Italy, with some further sales representatives working in Europe. Ecojoule offers a wide range of services and activities in all fields of renewable energies: photovoltaics, solar thermal, bioenergy, geothermal and passive houses. The company designs systems and provides technical support for installation. In 2009 the turnover was € 12 million. Ecojoule has a team of specialized engineers for the development of innovative products and took the most important step in the field of innovation in 2009 with the development and production of EJ EASY PICCO, an innovative PV mounting system. At Inter-solar the product was introduced to the European markets. But the technically experienced company also develops turn-key PV systems. Ecojoule delivers complete PV kits, crystalline, thin-film and glass-glass modules as well as high efficiency inverters and mounting systems for any kind of installation.

All in all, the mounting structures and PV modules are the most important products for Ecojoule today. The EJ EASY PICCO is based on the concept of creating a modular system for any kind of structure and configurations, from façades to open fields, and for any type of PV module, with a frame or frameless. The system is designed for a reduced thickness and for optimal building integration. The modularity of the system is based on the particular aluminium profile shape, which allows the combination of different profiles and different materials such as wood, steel or others. In the future Ecojoule will keep on developing new building-integrated solutions and bringing innovative products onto the market. The focus is on quality and architectonic aspects, rather than considering just the price.
